

ナショナルセンター・バイオバンクネットワーク (National Center Biobank Network: NCBN)

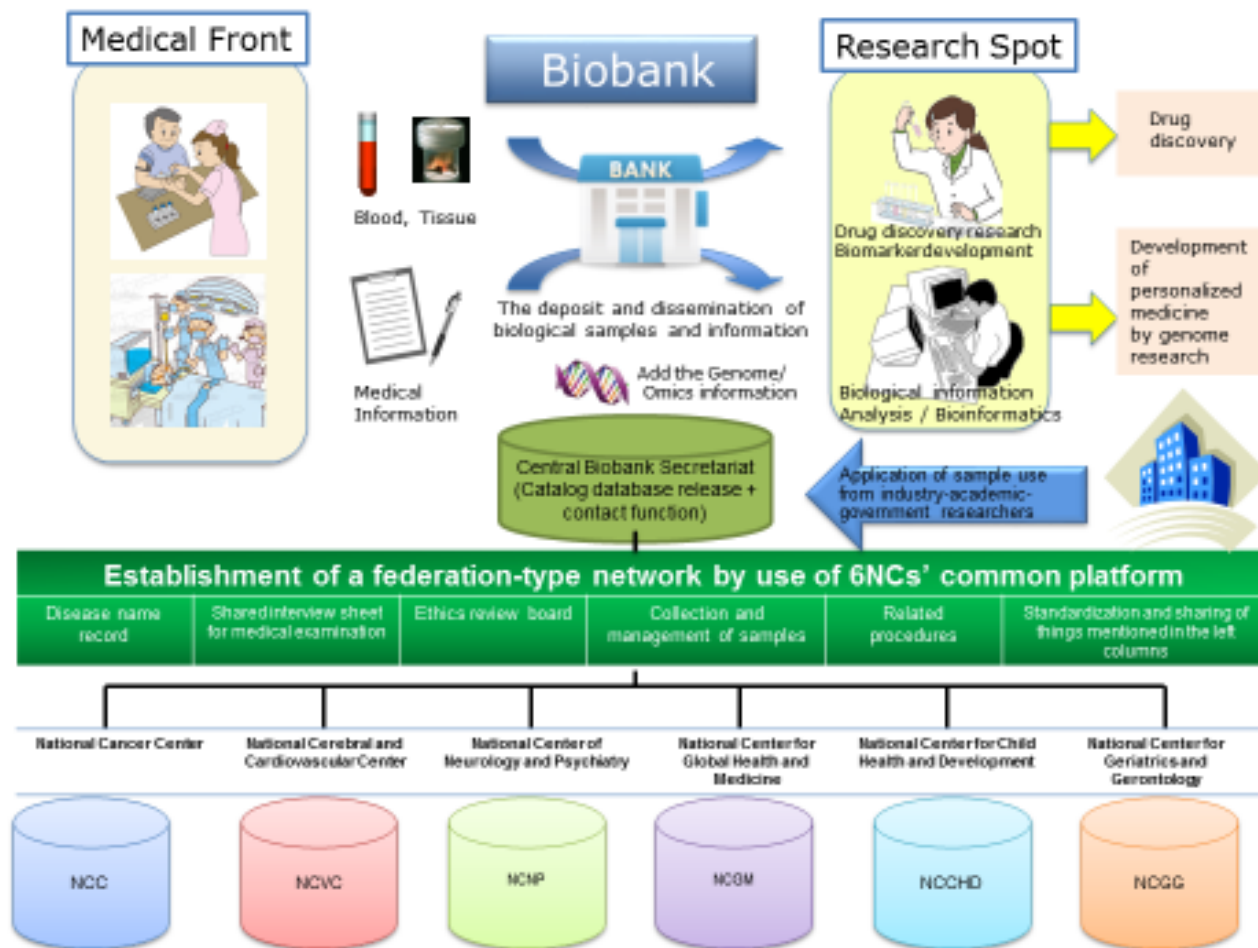

The mission of National Research Centers for Advanced and Specialized Medical Care (National Center: NC), which consists of six National Centers (6NCs), is to explore and overcome particular diseases that have a significant impact on national health.

The following documents explains the outline of the National Center Biobank Network (NCBN) Project for the cooperative researches of the 6NCs for medical “breakthroughs”.

●NCBNのOutline

The NCBN Project is managed by a network overarching the 6NCs. The Central Biobank of the NCBN employs experts in organizations such as the Central Database Management Sector and the Secretariat of the NCBN to provide highly effective and sustained research support services. The Biobank Management Committee was organized to promote the collection and practical use of bio-resources within a multicenter structure.

While each NC member actively expands bio-resource collection and maintenance, a “common platform” for bio-resource collection should be established for the 6NCs. This will create a structure that supports *broad* joint research with allied medical institutions and others.
